SWV Series

SWV: Super Wide View

No Gray Scale Inversion of TN Type TFT-LCD

INTRODUCTION

For TN-type TFT displays, gray scale inversion or image wash-out condition can often occur and hinder the displays' optical performance as the viewers attempt to view from lower or higher viewing directions. In order to improve such condition, wide viewing technologies, such as MVA · IPS TFT and Film-Enhancement technologies were introduced.

In hoping to provide a more flexible and cost efficient solution, EDT implements the SWV (Super Wide View) series, which offers 80 degrees of viewing angle on all directions (X+, X-, Y+, Y- = 80), by applying special surface treatment on film. It is available for standard products, sizes from 3.5" to 7.0", which allows a wide range of product offerings to suit various application requirements, product mix, and volume. For more details, please contact your local EDT representatives for additional information.
